

CRIMINAL DETENTION PORTAL

Presented by: Navya S

Introduction

- **The portal brings all prisoner and crime details into one platform.**
- **Tracks interviews, duty logs, and prisoner movement easily.**
- **Improves accuracy and reduces manual paperwork.**
- **Saves time by streamlining daily operations.**

Problem Statement

- Traditional record-keeping is manual and causes data loss or confusion.
- Multiple registers are maintained separately, making management difficult.
- Generating reports manually takes time and may include errors.
- There is no single system to track all activities inside detention centers.

Objectives

- To create a user-friendly system for storing prisoner and crime details.
- To track interview requests, duty activities, and movement logs digitally.
- To generate accurate reports quickly.
- To ensure better security, transparency, and accessibility of detention data.

System Modules

- **Login & Registration:** Provides secure access for officials.
- **Prisoner Details:** Stores personal details and case-related information.
- **Crime Details:** Captures crime type, description, and other case specifics.
- **Release Generator:** Automatically prepares release lists.
- **In-Out Register:** Tracks prisoner movement (court, hospital, etc.).
- **Reports:** Generates daily, weekly, and monthly summaries.

Workflow Overview

- Officials start by logging into the portal.
- Prisoner data and crime details are entered and updated as needed.
- Interview requests and movement logs are recorded in the system.
- The system organizes data and makes it easy to view or generate reports.
- Release lists and registers are automatically created when required.

Key Features

- Supports CRUD operations (Create, Read, Update, Delete) for all modules.
- Search functionality helps quickly locate prisoner or crime data.
- Automated report and release list generation saves time.
- Ensures data security and transparency with proper logs.
- Reduces manual errors and improves efficiency.

Technologies Used

- **Java** for program logic and user interaction.
- **JDBC** for database connection and data handling.
- **SQL** for storing, accessing, and managing data.
- **CLI Interface** for simple and fast operations.

THANK YOU !!
